
How the Survey was Conducted

Nature of the Sample: Yahoo-Marist Poll of 1,122 National Adults

This survey of 1,122 adults was conducted March 1st through March 7th, 2017 by The Marist Poll, sponsored and funded in partnership with Yahoo. Adults 18 years of age and older residing in the contiguous United States were contacted on landline or mobile numbers and interviewed in English or Spanish by telephone using live interviewers. Landline telephone numbers were randomly selected based upon a list of telephone exchanges from throughout the nation from ASDE Survey Sampler, Inc. The exchanges were selected to ensure that each region was represented in proportion to its population. Within each landline household, a single respondent was selected through a random selection process to increase the representativeness of traditionally under-covered survey populations. To increase coverage, this landline sample was supplemented by respondents reached through random dialing of mobile phone numbers from Survey Sampling International. Mobile phones are treated as individual devices. After validation of age, personal ownership, and non-business-use of the mobile phone, interviews are typically conducted with the person answering the phone. After the interviews were completed, the two samples were combined and balanced to reflect the 2013 American Community Survey 1-year estimates for age, gender, income, race, and region. Results are statistically significant within ± 2.9 percentage points. There are 573 adults who have tried marijuana. The results for this subset are statistically significant within ± 4.1 percentage points. There are 252 adults who use marijuana and 160 who report using it regularly, at least once or twice a month. The results for these subsets are statistically significant within ± 6.2 and ± 7.7 percentage points, respectively. The error margin was not adjusted for sample weights and increases for cross-tabulations.

How to Read Banners

'Banners' are a simple way to display tabular data. The following provides an explanation of how to read the banners.

1. Thinking of the entire table as a grid of cells, each cell contains a number. This number gives the *percentage* of respondents in a column in each cell.
2. Columns read vertically down the page.
3. The table headings present the people, or subgroup, each column represents. They are each noted with a letter.
4. The remaining rows present the column percentages for each valid response category to a question.
5. The banners include notations for statistical significance testing between columns. Each column is labeled with letters. If a letter is below a percent, it notes that this percent is statistically different from the percent of the lettered column. For example in the table below, the 86% in column D is statistically different from the 69% in column E. Marijuana users who are men are more likely to have used marijuana before going to a social event with friends than marijuana users who are women.
6. Please note totals may not add to 100% due to rounding.

Table MARPUBUSG
