
How the Survey was Conducted

Nature of the Sample: Yahoo1H Marist Poll of 1,122 National Adults

This survey of 1,122 adults was conducted March 1st through March 7th, 2017 by The Marist Poll, sponsored and funded in partnership with Yahoo1H. Adults 18 years of age and older residing in the contiguous United States were contacted on landline or mobile numbers and interviewed in English or Spanish by telephone using live interviewers. Landline telephone numbers were randomly selected based upon a list of telephone exchanges from throughout the nation from ASDE Survey Sampler, Inc. The exchanges were selected to ensure that each region was represented in proportion to its population. Within each landline household, a single respondent was selected through a random selection process to increase the representativeness of traditionally under-covered survey populations. To increase coverage, this landline sample was supplemented by respondents reached through random dialing of mobile phone numbers from Survey Sampling International. Mobile phones are treated as individual devices. After validation of age, personal ownership, and non-business-use of the mobile phone, interviews are typically conducted with the person answering the phone. After the interviews were completed, the two samples were combined and balanced to reflect the 2013 American Community Survey 1-year estimates for age, gender, income, race, and region. Results are statistically significant within ± 2.9 percentage points. There are 573 adults who have tried marijuana. The results for this subset are statistically significant within ± 4.1 percentage points. There are 252 adults who use marijuana and 160 who report using it regularly, at least once or twice a month. The results for these subsets are statistically significant within ± 6.2 and ± 7.7 percentage points, respectively. The error margin was not adjusted for sample weights and increases for cross-tabulations.
