

## How the Survey was Conducted

---

### **Nature of the Sample: McClatchy-Marist Poll of 1,587 National Adults**

This survey of 1,587 adults was conducted November 1<sup>st</sup> through November 3<sup>rd</sup>, 2016 by The Marist Poll, sponsored and funded in partnership with McClatchy. Adults 18 years of age and older residing in the contiguous United States were contacted on landline or mobile numbers and interviewed in English or Spanish by telephone using live interviewers. Landline telephone numbers were randomly selected based upon a list of telephone exchanges from throughout the nation from ASDE Survey Sampler, Inc. The exchanges were selected to ensure that each region was represented in proportion to its population. Respondents in the household were randomly selected by first asking for the youngest male. This landline sample was combined with respondents reached through random dialing of cell phone numbers from Survey Sampling International. Assistance was provided by Luce Research for data collection. After the interviews were completed, the two samples were combined and balanced to reflect the 2013 American Community Survey 1-year estimates for age, gender, income, race, and region. Results are statistically significant within  $\pm 2.5$  percentage points. There are 1,250 registered voters. The results for this subset are statistically significant within  $\pm 2.8$  percentage points. There are 940 likely voters defined by a probability turnout model which determines the likelihood respondents will participate in the 2016 Presidential Election based upon their chance of vote, interest in the election, and past election participation. The results for this subset are statistically significant within  $\pm 3.2$  percentage points. The error margin was not adjusted for sample weights and increases for cross-tabulations.
