

## How the Survey was Conducted

---

### **Nature of the Sample: NBC News/Marist Poll of 2,527 New Hampshire Adults**

This survey of 2,527 adults was conducted February 4<sup>th</sup> through February 6<sup>th</sup>, 2020 by The Marist Poll sponsored in partnership with NBC News. Adults 18 years of age and older residing in the state were contacted on landline or mobile numbers and interviewed by telephone using live interviewers. Survey questions were available in English. Mobile telephone numbers were randomly selected based upon a list of telephone exchanges from throughout the state from Dynata (formerly Survey Sampling International). The exchanges were selected to ensure that each region was represented in proportion to its population. Mobile phones are treated as individual devices. After validation of age, personal ownership, and non-business-use of the mobile phone, interviews are typically conducted with the person answering the phone. To increase coverage, this mobile sample was supplemented by respondents reached through random dialing of landline phone numbers. Within each landline household, a single respondent is selected through a random selection process to increase the representativeness of traditionally under-covered survey populations. Assistance was provided by Luce Research for data collection. The samples were then combined and balanced to reflect the 2017 American Community Survey 5-year estimates for age, gender, income, race, and region. Results are statistically significant within  $\pm 2.4$  percentage points. There are 2,241 registered voters. The results for this subset are statistically significant within  $\pm 2.5$  percentage points. There are 1,058 voters in the potential Democratic primary electorate. The potential Democratic primary electorate in New Hampshire includes undeclared voters who prefer to vote in the Democratic presidential primary and registered Democrats. The results for this subset are statistically significant within  $\pm 3.7$  percentage points. There are 768 voters in the potential Republican primary electorate. The potential Republican primary electorate in New Hampshire includes undeclared voters who prefer to vote in the Republican presidential primary and registered Republicans. The results for this subset are statistically significant within  $\pm 4.3$  percentage points. There are 709 likely Democratic primary voters and 441 likely Republican primary voters defined by a probability turnout model which determines the likelihood respondents will participate in the 2020 New Hampshire Presidential Primaries based upon their chance of vote, interest in the primary election, and past primary participation. The results for these subsets are statistically significant within  $\pm 4.7$  percentage points and  $\pm 5.8$  percentage points, respectively. Tables include results for subgroups with a minimum sample size of 100 unweighted completed interviews as to only display crosstabs with an acceptable sampling error. It should be noted that although you may not see results listed for a certain group, it does not mean interviews were not completed with those individuals. It simply means the sample size is too small to report. The error margin was adjusted for sample weights and increases for cross-tabulations.
