

How the Survey was Conducted

Nature of the Sample: New Hampshire Poll of 1,512 Adults

This survey of 1,512 adults was conducted on September 23rd through September 25th, 2012. Adults 18 years of age and older residing in the state of New Hampshire were interviewed by telephone. Telephone numbers were selected based upon a list of telephone exchanges from throughout the state. The exchanges were selected to ensure that each region was represented in proportion to its population. To increase coverage, this landline sample was supplemented by respondents reached through random dialing of cell phone numbers. The two samples were then combined and balanced to reflect the 2010 census results for age, gender, income, race, and region. Results for adults are statistically significant within ± 2.5 percentage points. There are 1,306 registered voters. The results for this subset are statistically significant within ± 2.7 percentage points. There are 1,012 likely voters defined by a probability turnout model. This model determines the likelihood respondents will vote in the 2012 presidential election based upon their chance of vote, interest in the election, and past election participation. The results for this subset are statistically significant within ± 3.1 percentage points. The error margin increases for cross-tabulations.
