

Nature of the Sample: 956 U.S. Residents

This survey of 956 United States residents was conducted on March 25th, March 26th, and March 29th. Residents 18 years of age and older were interviewed by telephone. Telephone numbers were selected based upon a list of telephone exchanges from throughout the nation. The exchanges were selected to ensure that each region was represented in proportion to its population. To increase coverage, this land-line sample was supplemented by respondents reached through random dialing of cell phone numbers. The two samples were then combined. Results are statistically significant at $\pm 3.5\%$. There are 485 residents who know someone with Alzheimer's disease and 270 residents who have a relative with Alzheimer's disease. The results for these subsets are statistically significant at $\pm 4.5\%$ and $\pm 6.0\%$, respectively. The error margin increases for cross-tabulations.
