

How the Survey was Conducted

Nature of the Sample: NBC 4 NY/Marist Poll of 981 New York Adults

This survey of 981 adults was conducted February 25th through March 4th, 2019 by The Marist Poll sponsored in partnership with NBC 4 New York. Adults 18 years of age and older residing in the state of New York were contacted on landline or mobile numbers and interviewed in English by telephone using live interviewers. Mobile telephone numbers were randomly selected based upon a list of telephone exchanges from throughout the state from Survey Sampling International. The exchanges were selected to ensure that each region was represented in proportion to its population. Mobile phones are treated as individual devices. After validation of age, personal ownership, and non-business-use of the mobile phone, interviews are typically conducted with the person answering the phone. To increase coverage, this mobile sample was supplemented by respondents reached through random dialing of landline phone numbers from Survey Sampling International. Within each landline household, a single respondent is selected through a random selection process to increase the representativeness of traditionally under-covered survey populations. The samples were then combined and balanced to reflect the 2016 American Community Survey 5-year estimates for age, gender, income, and region except for race, which is from the 2010 census. Results are statistically significant within ± 3.5 percentage points. There are 805 registered voters. The results for this subset are statistically significant within ± 3.8 percentage points. There are 410 registered Democrats. The results for this subset are statistically significant within ± 5.4 percentage points. Tables include results for subgroups with a minimum sample size of 100 unweighted completed interviews as to only display crosstabs with an acceptable sampling error. It should be noted that although you may not see results listed for a certain group, it does not mean interviews were not completed with those individuals. It simply means the sample size is too small to report. The error margin was adjusted for sample weights and increases for cross-tabulations.
