

How the Survey was Conducted

Nature of the Sample: NPR/Marist Poll of 1,172 National Adults

This survey of 1,172 adults was conducted November 30th through December 6th, 2021 by the Marist Poll sponsored in partnership with NPR. Adults 18 years of age and older residing in the United States were contacted on landline or mobile numbers and interviewed by telephone using live interviewers. Survey questions were available in English or Spanish. Mobile telephone numbers were randomly selected based upon a list of telephone exchanges from throughout the nation from Dynata. The exchanges were selected to ensure that each region was represented in proportion to its population. Mobile phones are treated as individual devices. After validation of age, personal ownership, and non-business-use of the mobile phone, interviews are typically conducted with the person answering the phone. To increase coverage, this mobile sample was supplemented by respondents reached through random dialing of landline phone numbers. Within each landline household, a single respondent is selected through a random selection process to increase the representativeness of traditionally under-covered survey populations. The samples were then combined and balanced to reflect the 2019 American Community Survey 1-year estimates for age, gender, income, race, and region. Assistance was provided by Luce Research for data collection. Results are statistically significant within ± 3.8 percentage points. There are 1,062 registered voters. The results for this subset are statistically significant within ± 4.0 percentage points. There are 723 adults who report receiving the stimulus check and 196 adults who report receiving the child tax credit payments. The results for these subsets are statistically significant within ± 4.8 percentage points and ± 9.2 percentage points, respectively. Tables include results for subgroups to only display crosstabs with an acceptable sampling error. It should be noted that although you may not see results listed for a certain group, it does not mean interviews were not completed with those individuals. It simply means the sample size is too small to report. The error margin was adjusted for sample weights and increases for cross-tabulations.
