## Nature of the Sample: Marist Poll of 1,511 National Adults

This survey of 1,511 adults was conducted October $23^{\text {rd }}$ through November $1^{\text {st }} 2023$ by the Marist Poll. Adults 18 years of age and older residing in the United States were contacted through a multi-mode design: By phone using live interviewers, by text, or online. Survey questions were available in English and Spanish. Phone and online samples were selected to ensure that each region was represented in proportion to its adult population. The samples were then combined and balanced to reflect the 2020 American Community Survey 5-year estimates for age, gender, income, race, and region. Results are statistically significant within $\pm 3.3$ percentage points. There are 1,318 registered voters. The results for this subset are statistically significant within $\pm 3.5$ percentage points. Tables include results for subgroups to only display crosstabs with an acceptable sampling error. It should be noted that although you may not see results listed for a certain group, it does not mean interviews were not completed with those individuals. It simply means the sample size is too small to report. The error margin was adjusted for sample weights and increases for cross-tabulations.
