

How the Survey was Conducted

Methodology: Marist Poll of 1,204 New York State Adults

This survey of 1,204 New York State adults was conducted April 3rd through April 9th, 2025 by the Marist Poll. Adults 18 years of age and older residing in the state of New York were contacted through a multi-mode design: By phone using live interviewers, by text, or online. All potential respondents were screened for age and residence (confirming New York State). Probability-based sampling frames include RDD landline plus listed landline, RDD cell phone sample plus cell phone sample based on billing address to account for inward and outward mobility within a state. These samples were provided by Dynata and used to administer the surveys collected via phone and text to web. A sampling frame based on aggregated non-probability online research panels was randomly selected from Cint's digital insights platform to administer the surveys collected via web. Survey questions were available in English or Spanish. Phone and online samples were selected to ensure that each region was represented in proportion to its population. The samples were then combined and balanced to reflect the 2021 American Community Survey 5-year estimates for age, gender, income, and race.

Results for all adults (n=1,204) are statistically significant within ± 3.5 percentage points. Results for registered voters (n=1,116) are statistically significant within ± 3.6 percentage points. Results for New York State adults planning to leave New York (n=384) are statistically significant within ± 6.2 percentage points. The design effect for this survey is 1.52 which has been incorporated in the calculation of all reported margins of error.

Tables include results for subgroups to only display crosstabs with an acceptable sampling error. It should be noted that, although you may not see results listed for a certain group, it does not mean interviews were not completed with those individuals. It simply means the sample size is too small to report.
